

There are two wireless networking options provided for students who bring their own laptops, smartphones, etc. to school. Our recommendation is that you try "HHS BYOD Secure" FIRST, because if it works, you will only have to log in one time and your device will remember the settings. However, not all devices are compatible with the enterprise-grade security settings on that network, so if HHS BYOD Secure does NOT work for you, you can instead connect to "HHS Wireless" which is more compatible, but which requires you to re-authenticate each time your device turns off or goes to sleep. Read on...

Connecting an Android device (and maybe others) to the HHS wireless network:

What worked for us with a Samsung Galaxy S III was:

- Use PEAP
- For the inner method, use PAP instead of MSCHAP
- Leave anonymous identity blank
- Skip "2nd phase" authentication
- No certificates

Beyond that, you're on your own, OR use HHS Wireless.
