

There are two wireless networking options provided for students who bring their own laptops, smartphones, etc. to school. Our recommendation is that you try "HHS BYOD Secure" FIRST, because if it works, you will only have to log in one time and your device will remember the settings. However, not all devices are compatible with the enterprise-grade security settings on that network, so if HHS BYOD Secure does NOT work for you, you can instead connect to "HHS Wireless" which is more compatible, but which requires you to re-authenticate each time your device turns off or goes to sleep. Read on...

### Connecting a Macintosh computer to the HHS wireless network:

1. Connect to "HHS BYOD Secure."

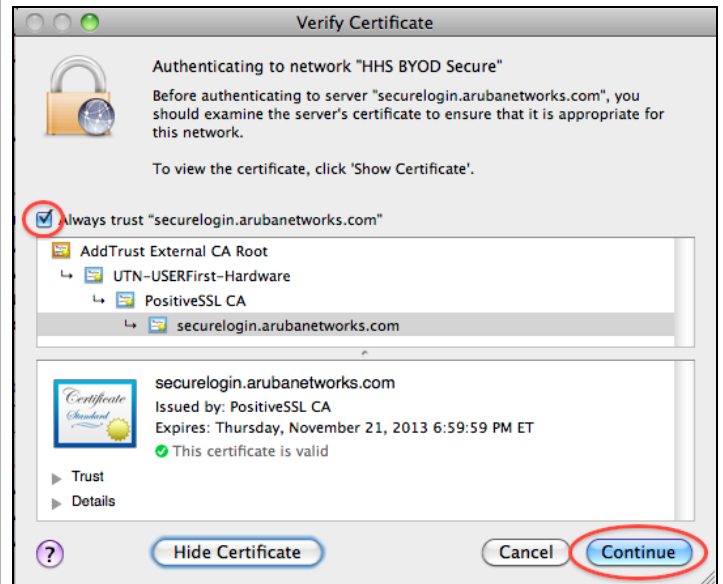

2. Enter your username and password -- the same ones you use to log in to lab computers etc. TYPE CAREFULLY -- it can be troublesome to start over if you mistype it.

3. When the certificate warning appears, click "Show Certificate."

4. If it's not already selected, check the box to "Always Trust" and then "Continue."

5. If necessary, enter the administrator-enabled username/password of the account **on your device** to allow changes.
